

**Module** java.base

## Package java.lang

package java.lang

Provides classes that are fundamental to the design of the Java programming language. The most important classes are `Object`, which is the root of the class hierarchy, and `Class`, instances of which represent classes at run time.

Frequently it is necessary to represent a value of primitive type as if it were an object. The wrapper classes `Boolean`, `Character`, `Integer`, `Long`, `Float`, and `Double` serve this purpose. An object of type `Double`, for example, contains a field whose type is `double`, representing that value in such a way that a reference to it can be stored in a variable of reference type. These classes also provide a number of methods for converting among primitive values, as well as supporting such standard methods as `equals` and `hashCode`. The `Void` class is a non-instantiable class that holds a reference to a `Class` object representing the type `void`.

The class `Math` provides commonly used mathematical functions such as sine, cosine, and square root. The classes `String`, `StringBuffer`, and `StringBuilder` similarly provide commonly used operations on character strings.

Classes `ClassLoader`, `Process`, `ProcessBuilder`, `Runtime`, `SecurityManager`, and `System` provide "system operations" that manage the dynamic loading of classes, creation of external processes, host environment inquiries such as the time of day, and enforcement of security policies.

Class `Throwable` encompasses objects that may be thrown by the `throw` statement. Subclasses of `Throwable` represent errors and exceptions.

## Character Encodings

The specification of the `java.nio.charset.Charset` class describes the naming conventions for character encodings as well as the set of standard encodings that must be supported by every implementation of the Java platform.

**Since:**  
1.0

Related Packages		
Module	Package	Description
java.base	<b>java.lang.annotation</b>	Provides library support for the Java programming language annotation facility.
java.base	<b>java.lang.constant</b>	Classes and interfaces to represent <i>nominal descriptors</i> for run-time entities such as classes or method handles, and classfile entities such as constant pool entries or invokedynamic call sites.
java.instrument	<b>java.lang.instrument</b>	Provides services that allow Java programming language agents to instrument programs running on the JVM.
java.base	<b>java.lang.invoke</b>	The <code>java.lang.invoke</code> package provides low-level primitives for interacting with the Java Virtual Machine.
java.management	<b>java.lang.management</b>	Provides the management interfaces for monitoring and management of the Java virtual machine and other components in the Java runtime.
java.base	<b>java.lang.module</b>	Classes to support module descriptors and creating configurations of modules by means of resolution and service binding.
java.base	<b>java.lang.ref</b>	Provides reference-object classes, which support a limited degree of interaction with the garbage collector.
java.base	<b>java.lang.reflect</b>	Provides classes and interfaces for obtaining reflective information about classes and objects.
java.base	<b>java.lang.runtime</b>	The <code>java.lang.runtime</code> package provides low-level runtime support for the Java language.

All Classes and Interfaces	Interfaces	Classes	Enum Classes	Exception Classes	Annotation Interfaces
Class		Description			
<b>AbstractMethodError</b>		Thrown when an application tries to call an abstract method.			
<b>Appendable</b>		An object to which char sequences and values can be appended.			
<b>ArithmeticException</b>		Thrown when an exceptional arithmetic condition has occurred.			
<b>ArrayIndexOutOfBoundsException</b>		Thrown to indicate that an array has been accessed with an illegal index.			
<b>ArrayStoreException</b>		Thrown to indicate that an attempt has been made to store the wrong type of object into an array of objects.			
<b>AssertionError</b>		Thrown to indicate that an assertion has failed.			
<b>AutoCloseable</b>		An object that may hold resources (such as file or socket handles) until it is closed.			

<b>Boolean</b>	The Boolean class wraps a value of the primitive type <code>boolean</code> in an object.
<b>BootstrapMethodError</b>	Thrown to indicate that an <code>invokedynamic</code> instruction or a dynamic constant failed to resolve its bootstrap method and arguments, or for <code>invokedynamic</code> instruction the bootstrap method has failed to provide a <code>call site</code> with a <code>target</code> of the correct <code>method type</code> , or for a dynamic constant the bootstrap method has failed to provide a constant value of the required type.
<b>Byte</b>	The Byte class wraps a value of primitive type <code>byte</code> in an object.
<b>Character</b>	The Character class wraps a value of the primitive type <code>char</code> in an object.
<b>Character.Subset</b>	Instances of this class represent particular subsets of the Unicode character set.
<b>Character.UnicodeBlock</b>	A family of character subsets representing the character blocks in the Unicode specification.
<b>Character.UnicodeScript</b>	A family of character subsets representing the character scripts defined in the <i>Unicode Standard Annex #24: Script Names</i> <sup>Ⓔ</sup> .
<b>CharSequence</b>	A <code>CharSequence</code> is a readable sequence of <code>char</code> values.
<b>Class&lt;T&gt;</b>	Instances of the class <code>Class</code> represent classes and interfaces in a running Java application.
<b>ClassCastException</b>	Thrown to indicate that the code has attempted to cast an object to a subclass of which it is not an instance.
<b>ClassCircularityError</b>	Thrown when the Java Virtual Machine detects a circularity in the superclass hierarchy of a class being loaded.
<b>ClassFormatError</b>	Thrown when the Java Virtual Machine attempts to read a class file and determines that the file is malformed or otherwise cannot be interpreted as a class file.
<b>ClassLoader</b>	A class loader is an object that is responsible for loading classes.
<b>ClassNotFoundException</b>	Thrown when an application tries to load in a class through its string name using: The <code>forName</code> method in class <code>Class</code> .
<b>ClassValue&lt;T&gt;</b>	Lazily associate a computed value with (potentially) every type.
<b>Cloneable</b>	A class implements the <code>Cloneable</code> interface to indicate to the <code>Object.clone()</code> method that it is legal for that method to make a field-for-field copy of instances of that class.
<b>CloneNotSupportedException</b>	Thrown to indicate that the <code>clone</code> method in class <code>Object</code> has been called to clone an object, but that the object's class does not implement the <code>Cloneable</code> interface.
<b>Comparable&lt;T&gt;</b>	This interface imposes a total ordering on the objects of each class that implements it.
<b>Compiler</b>	Deprecated, for removal: This API element is subject to removal in a future version. <i>JIT compilers and their technologies vary too widely to be controlled effectively by a standardized interface.</i>
<b>Deprecated</b>	A program element annotated <code>@Deprecated</code> is one that programmers are discouraged from using.
<b>Double</b>	The Double class wraps a value of the primitive type <code>double</code> in an object.
<b>Enum&lt;E extends Enum&lt;E&gt;&gt;</b>	This is the common base class of all Java language enumeration classes.
<b>Enum.EnumDesc&lt;E extends Enum&lt;E&gt;&gt;</b>	A <code>nominal descriptor</code> for an enum constant.
<b>EnumConstantNotPresentException</b>	Thrown when an application tries to access an enum constant by name and the enum type contains no constant with the specified name.
<b>Error</b>	An <code>Error</code> is a subclass of <code>Throwable</code> that indicates serious problems that a reasonable application should not try to catch.
<b>Exception</b>	The class <code>Exception</code> and its subclasses are a form of <code>Throwable</code> that indicates conditions that a reasonable application might want to catch.
<b>ExceptionInInitializerError</b>	Signals that an unexpected exception has occurred in a static initializer.
<b>Float</b>	The Float class wraps a value of primitive type <code>float</code> in an object.
<b>FunctionalInterface</b>	An informative annotation type used to indicate that an interface type declaration is intended to be a <i>functional interface</i> as defined by the Java Language Specification.
<b>IllegalAccessError</b>	Thrown if an application attempts to access or modify a field, or to call a method that it does not have access to.
<b>IllegalAccessException</b>	An <code>IllegalAccessException</code> is thrown when an application tries to reflectively create an instance (other than an array), set or get a field, or invoke a method, but the currently executing method does not have access to the definition of the specified class, field, method or constructor.

<b>IllegalArgumentException</b>	Thrown to indicate that a method has been passed an illegal or inappropriate argument.
<b>IllegalCallerException</b>	Thrown to indicate that a method has been called by an inappropriate caller.
<b>IllegalMonitorStateException</b>	Thrown to indicate that a thread has attempted to wait on an object's monitor or to notify other threads waiting on an object's monitor without owning the specified monitor.
<b>IllegalStateException</b>	Signals that a method has been invoked at an illegal or inappropriate time.
<b>IllegalThreadStateException</b>	Thrown to indicate that a thread is not in an appropriate state for the requested operation.
<b>IncompatibleClassChangeError</b>	Thrown when an incompatible class change has occurred to some class definition.
<b>IndexOutOfBoundsException</b>	Thrown to indicate that an index of some sort (such as to an array, to a string, or to a vector) is out of range.
<b>InheritableThreadLocal</b> <T>	This class extends <code>ThreadLocal</code> to provide inheritance of values from parent thread to child thread: when a child thread is created, the child receives initial values for all inheritable thread-local variables for which the parent has values.
<b>InstantiationError</b>	Thrown when an application tries to use the Java <code>new</code> construct to instantiate an abstract class or an interface.
<b>InstantiationException</b>	Thrown when an application tries to create an instance of a class using the <code>newInstance</code> method in class <code>Class</code> , but the specified class object cannot be instantiated.
<b>Integer</b>	The <code>Integer</code> class wraps a value of the primitive type <code>int</code> in an object.
<b>InternalError</b>	Thrown to indicate some unexpected internal error has occurred in the Java Virtual Machine.
<b>InterruptedException</b>	Thrown when a thread is waiting, sleeping, or otherwise occupied, and the thread is interrupted, either before or during the activity.
<b>Iterable</b> <T>	Implementing this interface allows an object to be the target of the enhanced <code>for</code> statement (sometimes called the "for-each loop" statement).
<b>LayerInstantiationException</b>	Thrown when creating a <a href="#">module layer</a> fails.
<b>LinkageError</b>	Subclasses of <code>LinkageError</code> indicate that a class has some dependency on another class; however, the latter class has incompatibly changed after the compilation of the former class.
<b>Long</b>	The <code>Long</code> class wraps a value of the primitive type <code>long</code> in an object.
<b>Math</b>	The class <code>Math</code> contains methods for performing basic numeric operations such as the elementary exponential, logarithm, square root, and trigonometric functions.
<b>Module</b>	Represents a run-time module, either <a href="#">named</a> or unnamed.
<b>ModuleLayer</b>	A layer of modules in the Java virtual machine.
<b>ModuleLayer.Controller</b>	Controls a module layer.
<b>NegativeArraySizeException</b>	Thrown if an application tries to create an array with negative size.
<b>NoClassDefFoundError</b>	Thrown if the Java Virtual Machine or a <code>ClassLoader</code> instance tries to load in the definition of a class (as part of a normal method call or as part of creating a new instance using the <code>new</code> expression) and no definition of the class could be found.
<b>NoSuchFieldError</b>	Thrown if an application tries to access or modify a specified field of an object, and that object no longer has that field.
<b>NoSuchFieldException</b>	Signals that the class doesn't have a field of a specified name.
<b>NoSuchMethodError</b>	Thrown if an application tries to call a specified method of a class (either static or instance), and that class no longer has a definition of that method.
<b>NoSuchMethodException</b>	Thrown when a particular method cannot be found.
<b>NullPointerException</b>	Thrown when an application attempts to use <code>null</code> in a case where an object is required.
<b>Number</b>	The abstract class <code>Number</code> is the superclass of platform classes representing numeric values that are convertible to the primitive types <code>byte</code> , <code>double</code> , <code>float</code> , <code>int</code> , <code>long</code> , and <code>short</code> .
<b>NumberFormatException</b>	Thrown to indicate that the application has attempted to convert a string to one of the numeric types, but that the string does not have the appropriate format.
<b>Object</b>	Class <code>Object</code> is the root of the class hierarchy.

<b>OutOfMemoryError</b>	Thrown when the Java Virtual Machine cannot allocate an object because it is out of memory, and no more memory could be made available by the garbage collector.
<b>Override</b>	Indicates that a method declaration is intended to override a method declaration in a supertype.
<b>Package</b>	Represents metadata about a run-time package associated with a class loader.
<b>Process</b>	Process provides control of native processes started by <code>ProcessBuilder.start</code> and <code>Runtime.exec</code> .
<b>ProcessBuilder</b>	This class is used to create operating system processes.
<b>ProcessBuilder.Redirect</b>	Represents a source of subprocess input or a destination of subprocess output.
<b>ProcessBuilder.Redirect.Type</b>	The type of a <code>ProcessBuilder.Redirect</code> .
<b>ProcessHandle</b>	<code>ProcessHandle</code> identifies and provides control of native processes.
<b>ProcessHandle.Info</b>	Information snapshot about the process.
<b>Readable</b>	A <code>Readable</code> is a source of characters.
<b>Record</b>	This is the common base class of all Java language record classes.
<b>ReflectiveOperationException</b>	Common superclass of exceptions thrown by reflective operations in core reflection.
<b>Runnable</b>	The <code>Runnable</code> interface should be implemented by any class whose instances are intended to be executed by a thread.
<b>Runtime</b>	Every Java application has a single instance of class <code>Runtime</code> that allows the application to interface with the environment in which the application is running.
<b>Runtime.Version</b>	A representation of a version string for an implementation of the Java SE Platform.
<b>RuntimeException</b>	<code>RuntimeException</code> is the superclass of those exceptions that can be thrown during the normal operation of the Java Virtual Machine.
<b>RuntimePermission</b>	This class is for runtime permissions.
<b>SafeVarargs</b>	A programmer assertion that the body of the annotated method or constructor does not perform potentially unsafe operations on its <code>varargs</code> parameter.
<b>SecurityException</b>	Thrown by the security manager to indicate a security violation.
<b>SecurityManager</b>	Deprecated, for removal: This API element is subject to removal in a future version. <i>The Security Manager is deprecated and subject to removal in a future release.</i>
<b>Short</b>	The <code>Short</code> class wraps a value of primitive type <code>short</code> in an object.
<b>StackOverflowError</b>	Thrown when a stack overflow occurs because an application recurses too deeply.
<b>StackTraceElement</b>	An element in a stack trace, as returned by <code>Throwable.getStackTrace()</code> .
<b>StackWalker</b>	A stack walker.
<b>StackWalker.Option</b>	Stack walker option to configure the <a href="#">stack frame</a> information obtained by a <code>StackWalker</code> .
<b>StackWalker.StackFrame</b>	A <code>StackFrame</code> object represents a method invocation returned by <code>StackWalker</code> .
<b>StrictMath</b>	The class <code>StrictMath</code> contains methods for performing basic numeric operations such as the elementary exponential, logarithm, square root, and trigonometric functions.
<b>String</b>	The <code>String</code> class represents character strings.
<b>StringBuffer</b>	A thread-safe, mutable sequence of characters.
<b>StringBuilder</b>	A mutable sequence of characters.
<b>StringIndexOutOfBoundsException</b>	Thrown by <code>String</code> methods to indicate that an index is either negative or greater than the size of the string.
<b>SuppressWarnings</b>	Indicates that the named compiler warnings should be suppressed in the annotated element (and in all program elements contained in the annotated element).
<b>System</b>	The <code>System</code> class contains several useful class fields and methods.
<b>System.Logger</b>	<code>System.Logger</code> instances log messages that will be routed to the underlying logging framework the <code>LoggerFinder</code> uses.
<b>System.Logger.Level</b>	System <a href="#">loggers</a> levels.
<b>System.LoggerFinder</b>	The <code>LoggerFinder</code> service is responsible for creating, managing, and configuring loggers to the underlying framework it uses.

Thread	A <i>thread</i> is a thread of execution in a program.
Thread.State	A thread state.
Thread.UncaughtExceptionHandler	Interface for handlers invoked when a Thread abruptly terminates due to an uncaught exception.
ThreadDeath	An instance of ThreadDeath is thrown in the victim thread when the (deprecated) <code>Thread.stop()</code> method is invoked.
ThreadGroup	A thread group represents a set of threads.
ThreadLocal<T>	This class provides thread-local variables.
Throwable	The Throwable class is the superclass of all errors and exceptions in the Java language.
TypeNotPresentException	Thrown when an application tries to access a type using a string representing the type's name, but no definition for the type with the specified name can be found.
UnknownError	Thrown when an unknown but serious exception has occurred in the Java Virtual Machine.
UnsatisfiedLinkError	Thrown if the Java Virtual Machine cannot find an appropriate native-language definition of a method declared <code>native</code> .
UnsupportedClassVersionError	Thrown when the Java Virtual Machine attempts to read a class file and determines that the major and minor version numbers in the file are not supported.
UnsupportedOperationException	Thrown to indicate that the requested operation is not supported.
VerifyError	Thrown when the "verifier" detects that a class file, though well formed, contains some sort of internal inconsistency or security problem.
VirtualMachineError	Thrown to indicate that the Java Virtual Machine is broken or has run out of resources necessary for it to continue operating.
Void	The Void class is an uninstantiable placeholder class to hold a reference to the Class object representing the Java keyword <code>void</code> .
